INTRODUCTION

Welcome to our on farm sale at Kaiwara

This year we have 28 bulls on offer, they are an even line of deep easy doing hill country bulls, the summer like most of the east coast has dragged on and we've had to dip into our winter feed to keep things fed-interesting times ahead!! This year the bulls are sired by the ever-perennial Matauri J002, Kaiwara 619, Taimate Lazarus and Full Force.

I was able to attend the Angus ward to the Taranaki/King Country this year, it was a good chance to have a look around and visit various studs seeing a lot of good hill country cattle along the way. A range of speakers varying from animal genetics to motivational kept things interesting. With it being open to anyone I'd recommend attending the next one. Canterbury/Westland Angus was able to have it's fieldday up Flock Hill Station. We had a good look around via a farm tour with the field day seasoned Richard Hill showing us the farm development centred around a lucerne system, learning about the pros and cons of fitting a beef system alongside it. The Angus cattle looked a picture. We learnt about the history of the place and it was said by attendees it was one the best field days they had attended. If you would like to come to our next one flick me an email on kaiwaraangus@gmail.com.

We like to purchase new genetics every year to keep up to date, this is not only strengthening our genetics but also acts as a cross reference for our ebvs. This year we were able to buy some progeny of the \$86K Tangihau Top Gun at the Rangatira dispersal sale, the couple of heifers and bull calf averaged \$6500 and are looking the picture already. The sale saw cows AI'd to Kaiwara 480 sell very well and I believe there will be some exceptional progeny to come.

FMG have partnered with Angus NZ to cover the bulls free for the first 14 days at no cost to the purchaser, after that the opportunity to insure at 6.5% of the purchase price for 12 months is available. The instruction slip is at back of the catalogue.

The bulls have been bvd tested and vaccinated but will need a booster every year. Semen testing has been carried out were semen morphology and penis's were evaluated. It must be noted that if a bull is carrying an injury the first thing to decline is there semen quality. We endeavour to breed bulls that last and there's nothing better than seeing a 10 year old bull still doing the job for our clients (although it does slow sales up). Viewings are always welcome. We look forward to seeing you at the sale, if you can't make it you can watch online via bidr.

Cheers,
George Johns

MAP

ANGUSPURE PARTNER STUD

AngusPure NZ has teamed up with 88 Angus studs who share in our vision - to focus on the end consumer. This stud is proud to be named as one of them, and by using the finest genetics and implementing best management practice they can help you produce more premium quality Angus beef.

Only our AngusPure Partner studs display these devices in their sale catalogues. They indicate bulls endorsed by AngusPure NZ.

A ANGUSPURE ENDORSED BULLS

AngusPure continues to endorse bulls for sale that are in the top 40% of the breed for AngusPure index. This index gives commercial farmers confidence that by using this selection tool, bulls are most likely to leave progeny with superior carcase quality and at the same time achieve desirable outcomes for self replacing herds, as the AngusPure index still rewards cattle with strong maternal attributes like calving ease, scrotal and growth, along with carcase weight. To qualify for the 'A' endorsement, bulls must meet a minimum AngusPure index of +\$120.

These bulls will be => +\$120 for AngusPure index.

A+ EXTRA ANGUSPURE ENDORSEMENT FOR MARBLING

In addition to the 'A', and to assist bull buyers who wish to select for more marbling we are rewarding those animals that are in the top 25% of the breed for AngusPure index and who also have their marbling EBV (IMF) in the top 50% as well. These bulls will be awarded an 'A+' endorsement. Marbling is one of the very highest eating quality attributes and is necessary in order to meet some of the highest premium requirements for our new program, AngusPure Special Reserve. To qualify for the 'A+' endorsement, bulls must meet a minimum AngusPure index of +\$141. They must also meet the minimum marbling requirement of +1.7 for IMF

These bulls will be => +\$141 for AngusPure index and => + 1.7 for IMF EBV.

AngusPure recognises the need to lift the amount of marbling in our New Zealand cow genetics, in order to fill the requirements of consumers going forward. Marbling has two critical components; genetics and feeding. Feeding on a rising plane of nutrition is vital but without the genetics these attributes will not be able to express themselves.

CONDITIONS OF SALE

1. The sale will be conducted under the usual conditions of the North Canterbury Stock & Station Agents Association.
2. Each lot becomes the property of the purchaser at the fall of the hammer.
3. The vendors guarantee all bulls from the date of sale for structural soundness, feet, infertility or incapacity of service for three years. Under these circumstances we will replace the bull with a satisfactory replacement bull or issue a credit equal to the purchase price less the salvage value. This credit may be used at future bull sales. A veterinary certificate shall be produced by the purchaser when required. The guarantee does not cover incapacity or infertility due to injury, illness or cover costs for loss of profit due to partial fertility or neglect by the purchaser. The purchaser is to keep the bull in reasonable health and condition.
4. Free delivery of bulls in the South Island and to Feilding in the North Island within three weeks of the sale.
5. All bulls are tuberculosis tested in accordance with statutory regulations.

G.S.T. All bulls sold are G.S.T exclusive.

PURCHASING REBATE All intending purchasers **MUST** register at the sales office prior to the sale. A purchasing rebate of 6 % will be paid to non participating livestock companies and recognized independent livestock agents with approved credit facilities introducing and/or accompanying new buyers to the sale.

Arrangements must be made with the auctioneer **PRIOR TO THE SALE AND SETTLEMENT MADE ON THE BUYERS BEHALF WITHIN 14 DAYS.**

This sale will be hosted by bidr® (www.bidr.co.nz) as a HYBRID auction, with online bidding and a live-stream available on sale day, as well as the normal on-farm format. All intending ONLINE purchasers must register on bidr® in advance of the sale date, by visiting the website and using the “sign up” button, adding their contact information and nominating the agency they would like to purchase through and account held with that agency. Alternatively, purchasers can organise an agent from one of the agencies listed on bidr® to buy on their behalf. The bidr® team is always available to help purchasers get signed up and registered, and the HelpDesk is proudly managed in-house from the Waikato. Please call 0800 TO BIDR (0800 86 2437), or email enquiries@bidr.co.nz for assistance at any point.

OSH Every effort will be taken by the vendors, auctioneers, their staff and assistants, both on the day of the sale as well as any visits of inspection to ensure the safety of intending buyers and visitors. We wish however to advise that while this sale is run under normal management conditions, certain dangers exist in relation to livestock and their environment. Visitors should take care to ensure their personal safety.

bidr[®] is here.

EBVS EXPLAINED

EBVs

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

In the calculation of EBVs, the performance of individual animals within a contemporary group is directly compared to the average of other animals in that group. A contemporary group consists of animals of the same sex and age class within a herd, run under the same management conditions and treated equally. Indirect comparisons are made between animals reared in different contemporary groups, through the use of pedigree links between the groups.

EBVs are expressed in the units of measurement for each particular trait. They are shown as +ive or -ive differences between an individual animal's genetics difference and the genetic base to which the animal is compared. For example, a bull with an EBV of +50 kg for 600-Day Weight is estimated to have genetic merit 50 kg above the breed base of 0 kg. Since the breed base is set to an historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic progress within the breed.

The absolute value of any EBV is not critical, but rather the differences in EBVs between animals. Particular animals should be viewed as being "above or below breed average" for a particular trait.

Whilst EBVs provide the best basis for the comparison of the genetic merit of animals reared in different environments and management conditions, they can only be used to compare animals analysed within the same analysis. Consequently, TACE EBVs cannot be validly compared with EBVs for any other breed.

Although EBVs provide an estimate of an animal's genetic merit for a range of production traits, they do not provide information for all of the traits that must be considered during selection of functional animals. In all situations, EBVs should be used in conjunction with visual assessment for other traits of importance (such as structural soundness, temperament, fertility etc). A recommended practice is to firstly select breeding stock based on EBVs and to then select from this group to ensure that the final selections are otherwise acceptable.

EBVs are published for a range of traits covering fertility, calving ease, milking ability, growth, carcass merit and feed efficiency. When using EBVs to assist in selection decisions it is important to achieve a balance between the different groups of traits and to place emphasis on those traits that are important

to the particular herd, markets and environment. One of the advantages of having a comprehensive range of EBVs is that it is possible to avoid extremes in particular traits and select for animals with balanced overall performance.

Calving Ease EBVs (%) are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

CE % Direct = Direct Calving Ease - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

CE % Daughters = Daughters' Calving Ease - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age.

Gestation Length EBV (days) is an estimate of the time from conception to the birth of the calf and is based on AI and hand mating records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth.

Birth Weight EBV (kg) is based on the measured birth weight of progeny, adjusted for dam age. The lower the value, the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200-Day Growth EBV (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Mature Cow Weight EBV (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

Scrotal Size EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

Days to Calving EBV (days) indicates the fertility of the daughters of the sire. It is the time interval between the day when the female is first exposed to a bull in a paddock mating to the day when she subsequently calves. A negative EBV for days to calving indicates a shorter interval from bull-in date to calving and therefore higher fertility.

Carcase Weight EBV (kg) is based on abattoir carcass records and is an indicator of the genetic differences in carcass weight at the standard age of 750 days.

Eye Muscle Area EBV (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcass data, adjusted to a standard 400 kg carcass. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 400 kg dressed carcass. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better-muscled and higher percentage yielding progeny at the same carcass weight than will sires with lower EMA EBVs.

Rib Fat and Rump Fat EBVs (mm) are calculated from measurements of subcutaneous fat depth at the 12/13-rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 400 kg carcass. These EBVs are indicators of the genetic differences in fat distribution on a standard 400 kg carcass. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcass weight than will sires with higher EBVs.

Retail Beef Yield EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 400 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

Intramuscular Fat EBV (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th rib site in a 400 kg carcass. Depending on market targets, larger more positive values are generally more favourable.

Docility EBV (%) is an estimate of the genetic differences between animals in temperament. Docility EBVs are expressed as differences in the percentage of progeny that will be scored with acceptable temperament (ie. either "docile" or "restless").

SELECTION INDEXES

There are currently three selection indexes calculated for New Zealand Angus animals. These are Self-Replacing, AngusPure and Heifer/Dairy Terminal. Each selection index describes a different production/market scenario and relates to a typical commercial herd in New Zealand that is targeting the following specifications.

Index values are reported as EBVs, in units of relative earning capacity (\$) for a given market. They reflect both the short-term profit generated by a sire through the sale of his progeny, and the longer-term profit generated by his daughters in a self-replacing cow herd.

The Index values are derived using BreedObject technology.

Self-Replacing Index (\$) - Estimates the genetic differences between animals in net profitability per cow joined in an example self-replacing commercial herd that targets the production of grass finished steers. Steers are assumed marketed at approximately 480 kg live weight (265 kg carcass weight and 7 mm fat depth) at approximately 16 months of age. Selected heifers are retained for breeding and the balance marketed at approximately 16 months weighing 415 kgs (230 kg carcass weight and 8 mm fat depth) As some daughters are retained, maternal traits are also of importance.

AngusPure Index (\$) - Estimates the genetic differences between animals in net profitability per cow joined in an example self-replacing commercial Angus herd that targets the production of grass finished steers for the AngusPure programme. Steers are assumed marketed at 530 kg live weight (290 kg carcass weight and 10 mm fat depth) at approximately 20 months of age. Selected heifers are retained for breeding and the balance marketed at approximately 20 months weighing 450 kg (240 kg carcass weight and 10 mm fat depth). A significant premium for carcass quality was assumed and, as some daughters are retained, maternal traits are also of importance.

Heifer/Dairy Terminal Index (\$) - Estimates the genetic differences between animals in net profitability per female joined in an example herd where all progeny are marketed. All progeny are marketed at approximately 510 kg live weight (280 kg carcass weight and 7 mm fat depth) at approximately 24 months of age.

ANGUS INDEXES (\$) AVERAGES		
Self Replacing Index (\$)	AngusPure (\$)	Heifer / Dairy Terminal (\$)
+\$100	+\$104	+\$102

ACCURACY

Accuracy (%) is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. Hence accuracy indicates the “confidence level” of the EBV. The higher the accuracy value the lower the likelihood of change in the animal’s EBV as more information is analysed for that animal or its relatives. Even though an EBV with a low accuracy may change in the future, it is still the best estimate of an animal’s genetic merit for that trait. As more information becomes available, an EBV is just as likely to increase in value, as it is to decrease.

Accuracy values range from 0-99%.

As a rule, animals should be compared on EBVs regardless of accuracy. However, where two animals have similar EBVs the one with higher accuracy could be the safer choice, assuming other factors are equal.

For further information please contact NZ Angus or TACE.

NOTES

YOU CAN RELY ON FMG TO STAND BY YOU. LITERALLY.

A bull is a big investment. Which is why FMG is right there with you to ensure you get the very best cover on sale day, and the best service every day after that. That's because we understand livestock insurance as much as we understand the importance of personal service. So talk to your FMG Rural Manager about FMG Premier Bull Sales cover. All bulls sold at auction up to \$50,000 can be covered for 6.5% of the purchase price and those sold at FMG Premier Bull Sales are insured at the fall of the hammer for 14 days free.* To find out more, call us on 0800 366 466 or visit fmg.co.nz/bulls

* Subject to standard underwriting criteria. Please note this is only a summary of FMG products and services and is subject to our specific product documentation. For full details, refer to the relevant policy wordings at fmg.co.nz

We're here for the good of the country.

FMG
Advice & Insurance

Premier Bull cover

What is Premier Bull cover?

All bulls auctioned at this sale up to the value of \$50,000 will automatically be covered under FMG's Premier Bull cover for 14 days at no cost to the purchaser.

Length of cover

To extend cover for the specified bull beyond 14 days you need to tick Premier Bull cover 12 months on the Purchaser Instruction and Insurance Slip in this catalogue. The specified bull is then covered for the remaining period of 12 months. The premium is payable to FMG and is in addition to the purchase price of the bull.

If you require an alternative cover period talk to an FMG representative.

Your bull's value

Any bull covered under this policy must be purchased for \$50,000 or less. For any bull purchased over \$50,000 talk to an FMG representative.

During the period of insurance, the specified animal is covered for:

- Death or infertility as a result of accident, disease or illness.
- Transit.
- Theft.

What we will pay

Fair market value of your specified bull, less any amount you receive for the sale of the carcass, up to the amount shown on the insurance certificate.
